

What is Childhood Cancer?

How Cancer Forms

Bodies are made up of cells, each with a certain job like growing hair.

A cell usually does its job; but sometimes a cell can grow like weeds, spreading to places it shouldn't be.

These cells are what becomes cancer.

Things to Know

Cancer in kids is **rare**.

Cancer is not contagious.

How Everyone is Making a Difference

To cure cancer, doctors need to find a way to remove the cancer cells and stop them from coming back.

Researchers are studying cancer in their labs. Doctors work with their patients to select the best medicine available.

People everywhere raise money to help support research and make cures available faster for kids.
